Brian Wang-chen PSOFT

I should have looked over the discussion forum for clarifications first because the one bug in professorParser caused some time for me because I ended up rewriting the algorithm to get all the professors and courses. However I did not need to rewrite it because the bug was mentioned and solved in the forum. Other than that the homework went pretty well as understanding hw4 completely really made hw5 simple. I thought the homework was perfectly fine the way it was. I definitely felt like I understand object oriented programming a lot more now after homework 4 and 5. I understand how Graph works and how other classes such as professor Graph can use graphs to represent data. I also learned a few new skills through creating the large test case I had. I wrote a python program that used web scraping to gather a bunch of names from a website. I then assigned each name to a random number of subjects to reflect on how many classes each person was taking. I know it not exactly related to the homework but It was something I learned from this homework.
